

Annalist Data Notebook: Towards Making Research Objects

Response: Annalist, "Keeper of Records"

Annalist is a software tool that can be used "off-the-shelf" to create structured data, without prior design of schemas or ontologies. Structure is introduced on-the-fly according to the available data.

Example: Simple Musical Instrument Catalogue

Example: Canal Cruising Log

(It's not research data, but I contend it has similar properties)

Example: Bibliographic Records

(This one still needs some work)

Also: Data Record Type, List and View configuration
